# Chapter 1

## Introduction

The extreme compact IRU131-FL supports the low power RISC-based module (i.MX6UL) processor with extended temperature range of -40°C to +70°C for using in wide range operating environments. Multiple built-in serial ports, high-speed LANs and USB 2.0 ports enable fast and efficient data computation, communication and acquisition. Its digital I/O feature provides users with the convenience of digital devices connection. Besides, Its compact size with Din-rail mounting allows for easy installation into control

This user's manual is for the embedded Linux preinstalled in IRU131. The embedded Linux is derived from Linux Yocto Board Support Package, which is based on Linux Kernel 3.14.52 and our hardware patches to suit IRU131.

### **Software structure**

The preinstalled embedded Linux image is located in eMMC Flash memory which is partitioned and formatted to accommodate boot loader, kernel and root filesystem. It follows standard Linux architecture to allow user to easily develop and deploy application software that follows Portable Operating System Interface (POSIX).

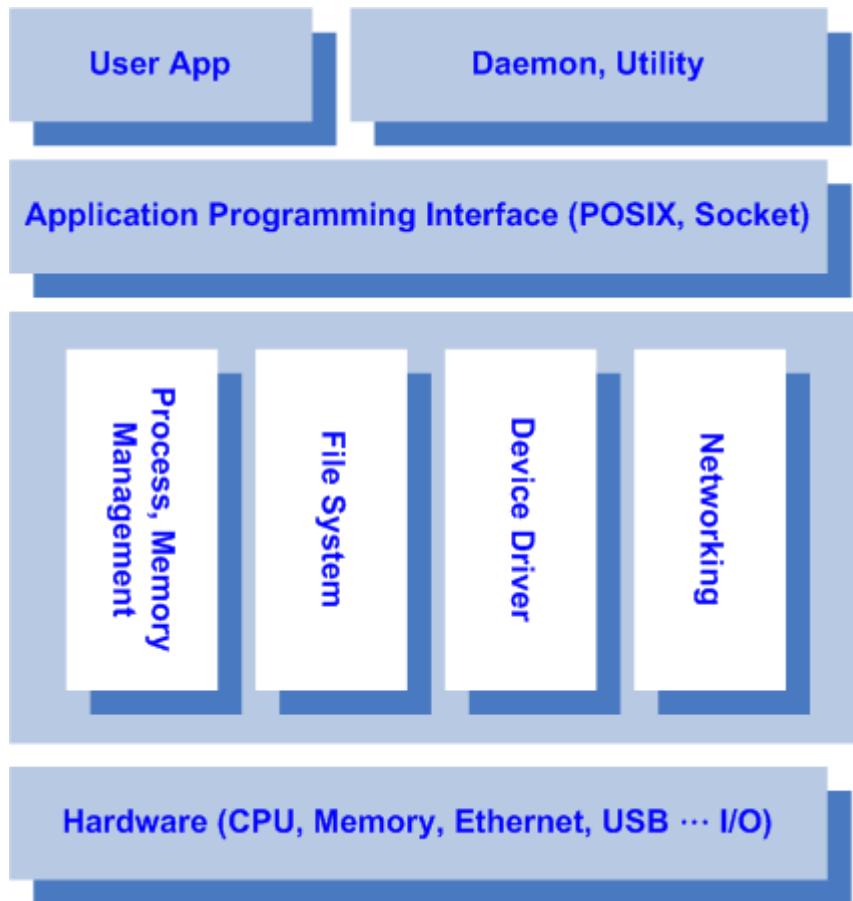

To facilitate user program in monitoring and controlling I/O device such as DIO, Watchdog Timer, DIP switch, USB power, comport , the IRU131 includes 'librsb20x.so' shared library.

In addition to ext3 and ext4 file system, this embedded Linux kernel is compiled with support for NFS, including server-side, client-side functionality and 'Root file system on NFS'. Using an NFS root mount we have several advantages such as:

- The root file system is not size-restricted by the device's storage like Flash memory.
- Change made to application files during development is immediately available to the target device.

For connectivity, this image includes most popular internet protocols, some servers and utilities not only making it easy for downloading/uploading files (Linux kernel, application program) or for debugging, but also communicating to outside world via Ethernet, WiFi and 3G.

For the convenience of manipulating embedded Linux, this image includes lots of popular packages such as busybox, udev, etc.

## 1.1 Specifications

OS	Yocto Project 1.8.1 Fido
Kernel	Version : 3.14.52 (with NXP and Axiomtek's modified hardware patch)
Busybox	Version:1.23.1, a collection of standard Linux command-line utilities
Storage formats	Support FAT32/FAT/EXT2/EXT3/EXT4
Shell	Bash
BSP	IRU1A-Linux-bsp <ul style="list-style-type: none"> <li>● AxTools</li> <li>● Image</li> <li>● Yocto patches</li> <li>● Toolchain</li> <li>● Mfgtool</li> </ul>
Protocol type	ICMP, TCP/IP, UDP, DHCP, Telnet, HTTP, HTTPS, SSL, SMTP, NTP, DNS, PPP, PPPoE, FTP, TFTP, NFS, OPC-UA, MQTT
<b>Daemons</b>	
Telnetd	Telnet server daemon
Ftpd	FTP server daemon
Sshd	Secure shell server
Pppd	Point-to-point protocol

<b>Utilities</b>	
Telnet	Telnet client program
FTP	FTP client program
TFTP	Trivial File Transfer Protocol client
Udev	A device manager for Linux kernel
Dosfstools	Utilities for making and checking MS-DOS FAT file system
E2fsprogs	A set of utilities for maintaining the ex2,ext3 and ext4 file systems
Ethtool	A Linux command for displaying or modifying the Network Interface Controller (NIC) parameters
I2c-tools	A heterogeneous set of i2c tools for Linux
Procps	Utilities to report on the state of the system, including the states of running processes and amount of memory
Wireless-tools	A package of Linux commands (simple text-based utilities/tools) intended to support and facilitate the configuration of wireless devices using the Linux Wireless Extension
Iperf	Network performance measurement tool
Xinetd	Manages internet-based connectivity
Openssh	Based on SSH protocol for remotely controlling or transferring files
Openssh-sftp	Secure File Transfer Protocol
Ntp	Network Time Protocol, used to synchronize time
Wvdial	Point-to-Point Protocol dialer
Curl	Transfer data tool
Mosquitto	Version : 1.5, provide MQTT broker and tools
Python	Version : 2.7, Python development environment
Nodejs	Version : 8.11.2, cross-platform JavaScript run-time environment
Gcc	Version : 4.9.2, cross compiler
G++	Version : 4.9.2, cross compiler
<b>Development Environment</b>	
Host OS/development	Ubuntu 14.04 LTS 32/64bit
Kernel	Version : 4.2.0-42
Toolchain	ARM, gcc-4.9.2 (Yocto project 1.8.1 Fido)
Machine running Ubuntu: the minimum hard disk space required is about 50 GB for the X11 backend. It is recommended that at least 120 GB is provided in order to have sufficient space to compile all backends together.	
<b>Hardware's Library</b>	
Comport	- RS-232/422/485 mode setting (Default RS232)
Watchdog timer	- Enable Watch Dog Timer - Set Timer
DIP switch	- Get DIP switch status

USB Power	- Disable/Enable USB Power
Wi-Fi (Optional)	- Use a Wi-Fi module WPEQ-160ACN
3G (Optional)	- Use a 3G module Quectel UC20
4G (Optional)	- Use a 4G module MC7304, LARA-R211 or LARA-R280

**Note**

1. *All specifications and images are subject to change without notice..*
2. *Command definition:*

Command	Definition	Example
=>	<b>U-Boot</b>	Ex: => setenv ipaddr 192.168.1.103 Meaning: U-Boot setenv ipaddr 192.168.1.103
~\$	<b>Host PC</b>	Ex: ~\$ sudo apt-get install subversion Meaning: To command sudo apt-get install subverhsion <b>on host PC</b>
~#	<b>Target (IRU-1A):</b>	Ex: ~# /etc/run_rescue Meaning: To command /etc/run_rescue <b>on IRU131</b>

# Chapter 2

## Getting Started

### 2.1 Connecting the IRU131

#### The power

Please check your power as below:

1. DC input range 9~48V
2. DC Terminal Block

Pin	DC Signal Name
1	Power+
2	Power-
3	DI
4	DI_G

#### The console

Connect your computer to the IRU131 via a serial cable and change the switch to Console mode (as below).

You can connect the IRU131 to personal computer (PC) in two ways:

- Serial RS-232 console
- SSH over Ethernet

Note

**Please download IRU131 support package from Axiomtek's website listed below.**

1. Download BSP and User's manual
2. Download OPC UA application

<http://www.axiomtek.com/Default.aspx?MenuId=Products&FunctionId=ProductView&ItemI d=24294&upcat=134>

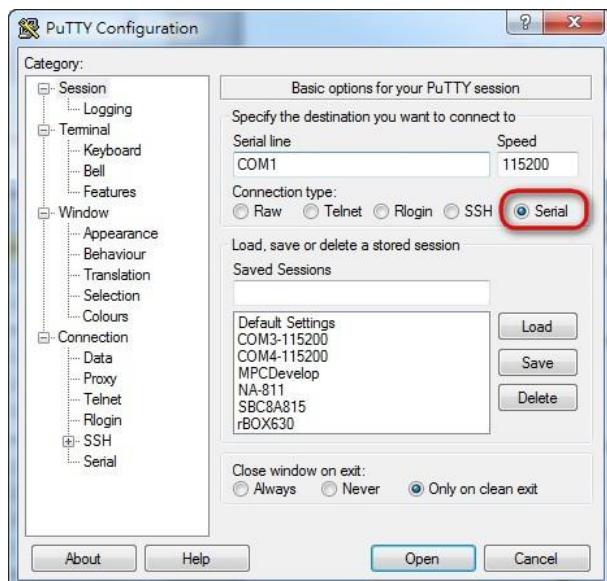

### 2.1.1 Serial Console

**The serial console is a convenient interface for connecting IRU131 to PC. First of all, it is very important to make sure that your desktop connects to IRU131 by console cable. Please set the system as follows:**

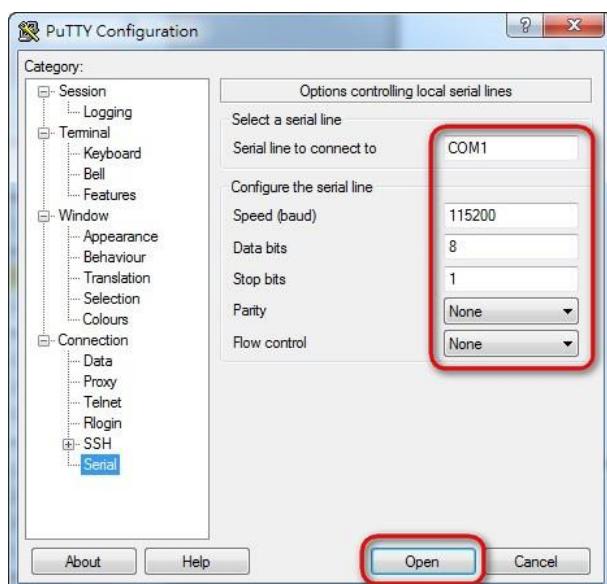

**Baudrate:** 115200 bps  
**Parity:** None  
**Data bits:** 8  
**Stop bit:** 1  
**Flow Control:** None

Here we use PuTTY to setup and link to the IRU131. Learn how to do it with these step by step instructions:

1. Open PuTTY and choose 'Serial' as the connection type.

2. Configure the serial port correctly (see image below). Click Open and power on the IRU131.

3. The Bootloader default booting system from eMMC.

```

U-Boot 2015.04-imx_v2015.04_3.14.52_1.1.0_ga (Jun 16 2017 - 10:11:18)

axiomtek login: root
root@axiomtek:~# 
```

## 2.1.2 SSH over Ethernet

Now, we are going to connect the IRU131 to PC over Ethernet. The following illustrations show how to do it under Windows® and Linux environment.

Before starting SSH, you have to check your LAN1 IP address.

```

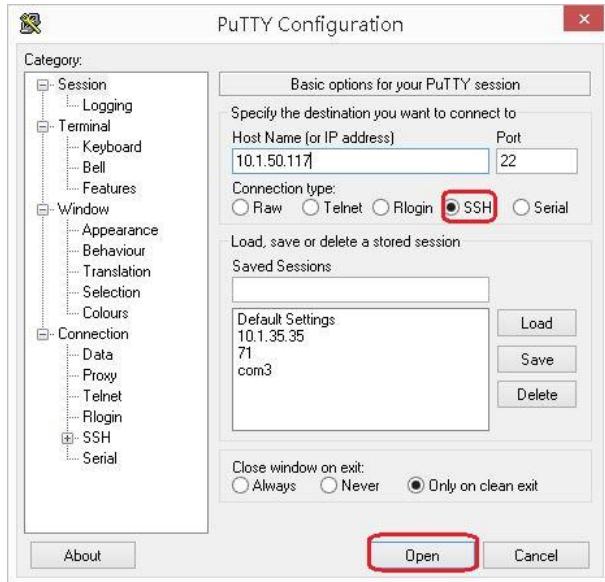

root@axiomtek:~# ifconfig
eth0      Link encap:Ethernet HWaddr B6:9B:9F:DC:C5:B7
          inet addr:10.1.50.117  Bcast:10.1.50.255  Mask:255.255.255.0
          inet6 addr: fe80::b49b:9fff:fedc:c5b7/64 Scope:Link
            UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
            RX packets:11113 errors:0 dropped:316 overruns:0 frame:0
            TX packets:55 errors:0 dropped:0 overruns:0 carrier:0
            collisions:0 txqueuelen:1000
            RX bytes:1175556 (1.1 MiB)  TX bytes:6259 (6.1 KiB)

lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
            UP LOOPBACK RUNNING  MTU:65536  Metric:1
            RX packets:0 errors:0 dropped:0 overruns:0 frame:0
            TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
            collisions:0 txqueuelen:0
            RX bytes:0 (0.0 B)  TX bytes:0 (0.0 B)

root@axiomtek:~# 
```

**For Windows® users:**

1. Here we also use PuTTY to setup and link. Open PuTTY and choose 'SSH' as the connection type. Then set the IP address to 10.1.50.117 and click Open.

2. If connection is established successfully, you should see the following image.

3. To login IRU131, please enter 'root' (with no password).

#### For Linux users:

1. Open terminal and keyin 'ssh' command.

```
~$ ssh -l root 10.1.50.117  
ryan@OMG:~$ ssh -l root 10.1.50.117
```

2. The following data appears after the connection is established successful.

```
ryan@OMG:~$ ssh -l root 10.1.50.117  
The authenticity of host '10.1.50.117 (10.1.50.117)' can't be established.  
ECDSA key fingerprint is 19:44:21:77:ae:b2:36:c5:e6:25:f5:9e:25:af:93:ae.  
Are you sure you want to continue connecting (yes/no)? yes  
Warning: Permanently added '10.1.50.117' (ECDSA) to the list of known hosts.  
Last login: Wed Jun 28 06:53:41 2017 from 10.1.35.67  
root@axiomtek:~#
```

## 2.2 How to Develop a Sample Program

In this section, learn how to develop a sample program for IRU131 with the following step by step instructions. The sample program is named 'hello.c'.

1. Create a directory for IRU131 BSP (IRU1A\_Linux\_x.x.x.zip); related to IRU131 file

```
~$ mkdir project  
~$ cd project  
ryan@Ubuntu:~$ mkdir project  
ryan@Ubuntu:~$ cd project/  
ryan@Ubuntu:~/project$ ls  
IRU1A_Linux_V.1.0.1.zip
```

2. After extracting the file, you will find a directory IRU131-LINUX-bsp-x.x.x

```
ryan@Ubuntu:~/project$ cd IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/  
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1$ ls  
AxTools Image README.txt Toolchain Yocto patches
```

**AxTools** : This directory include hardware driver and API library

**Image** : This directory include kernel, rootfilesystem,dtb

**Note** **Yocto patches** : This directory include IRU131 hardware patches for Yocto Project 1.8.1

**Toolchain** : This directory include cross compiler toolchain build from Yocto Project 1.8.1

**README.txt** : This BSP's documentation file

## 2.2.1 Install Yocto Toolchain

Before you develop and compile sample program, you should install Yocto toolchain into development PC. To install Yocto toolchain or refer to Chapter 5 Board Support Package to build the toolchain for IRU131.

1. To check your Ubuntu version on your host PC.

```
~$ uname -m
```

**Ubuntu 64-bit (x86\_64):**

```
ryan@Ubuntu:~$ uname -m
x86_64
```

2. Copy the toolchain script to home directory.

i686 for 32-bit machines or x86\_64 for 64-bit machines.

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1$ cd Toolchain/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ ls
32-bit 64-bit
```

3. Execute the toolchain script and press Enter to install to default directory.

**32-bit machines:**

```
~$ bash poky-glibc-i686-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ cd 32-bit/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain/32-bit$ bash poky
-glibc-i686-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
```

**64-bit machines:**

```
~$ bash poky-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ cd 64-bit/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain/64-bit$ bash poky
-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
```

- 4 Check the directory.

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ cd 64-bit/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain/64-bit$ bash poky
-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
```

- 5 Wait to installation.

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ cd 64-bit/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain/64-bit$ bash poky
-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
You are about to install the SDK to "/opt/poky/1.8.1". Proceed[Y/n]?y
Extracting SDK...done
```

## 6 Install finish.

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain$ cd 64-bit/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/Toolchain/64-bit$ bash poky
-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
You are about to install the SDK to "/opt/poky/1.8.1". Proceed[Y/n]?y
Extracting SDK...done
Setting it up...done
SDK has been successfully set up and is ready to be used.
```

## 2.2.2 Setting Up the Cross-Development Environment

Before you can develop using the cross-toolchain, you need to set up the cross-development environment, and then you can find this script in the directory you chose for installation.

1. To set up cross-toolchain environment.

```
~$ source /opt/poky/1.8.1/environment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
ryan@Ubuntu:~$ source /opt/poky/1.8.1/environment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
```

2. Check whether the Cross-Development Environment is successfully set up. You will find the information below if setup is successful.

```
~$ echo $CC
ryan@Ubuntu:~$ echo $CC
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfpu=neon -mtune=cortex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueabi
```

## 2.2.3 Write and Compile Sample Program

1. Create a directory on your host PC

```
~$ mkdir -p example
~$ cd example
louis@ubuntu:~/project$ mkdir -p example
louis@ubuntu:~/project$ cd example/
louis@ubuntu:~/project/example$
```

2. Use vi to edit hello.c.

```
~$ vi hello.c
```

```
#include<stdio.h>
int main()
{
    printf("hello world\n");
    return 0;
}
#include<stdio.h>
int main()
{
    printf("hello world\n");
    return 0;
}
```

3. To compile the program, enter the commands:

```
~$ $CC hello.c -o hello
```

```
ryan@Ubuntu:~/project/example$ $CC hello.c -o hello
```

4. After compiling, enter the following command and you can see the 'hello' execution file.

```
~$ ls -l
ryan@Ubuntu:~/project/examples$ ls -l
total 16
-rwxrwxr-x 1 ryan ryan 9669 6月 29 16:32 hello
-rw-rw-r-- 1 ryan ryan    72 6月 29 16:32 hello.c
```

5. Check whether the ARM executable format is created successfully. You will see the information below if the format is successfully created

```
~$ file hello
ryan@Ubuntu:~/project/examples$ file hello
hello: ELF 32-bit LSB executable, ARM, EABI5 version 1 (SYSV), dynamically linked, interpreted
 /lib/ld-linux-armhf.so.3, for GNU/Linux 2.6.32, BuildID[sha1]=be20b9cf2ff90de9abcd3db275fa
f058bd2961b, not stripped
```

## 2.3 How to Put and Run a Sample Program

This section shows how to put the 'hello' program into the IRU131 and execute the program via FTP, a USB flash drive, and TFTP.

### 2.3.1 Via FTP

The IRU131 has a built-in FTP server. Users can put 'hello' program to IRU131 via FTP by following the steps below.

1. Enable FTPD daemon on IRU131  
Use vi to create /etc/xinetd.d/ftpd file

```
~# vi /etc/xinetd.d/ftpd

service ftp
{
    port = 21
    disable = no
    socket_type = stream
    protocol = tcp
    wait = no
    user = root
    server = /usr/sbin/ftpd
    server_args = -w /home/root
}

service ftp
{
    port = 21
    disable = no
    socket_type = stream
    protocol = tcp
    wait = no
    user = root
    server = /usr/sbin/ftpd
    server_args = -w /home/root
}
```

2. Restart FTP server on IRU131

```
~# /etc/init.d/xinetd reload  
~# /etc/init.d/xinetd restart  
root@axiomtek:~# /etc/init.d/xinetd reload  
Reloading internet superserver configuration: xinetd.  
root@axiomtek:~# /etc/init.d/xinetd restart  
Stopping internet superserver: xinetd.  
Starting internet superserver: xinetd.  
root@axiomtek:~#
```

3. To connect your host PC to IRU131.

```
~$ ftp 10.1.50.117 (username 'root' without password)  
ryan@Ubuntu:~/project/example$ ftp 10.1.50.117  
Connected to 10.1.50.117.  
220 Operation successful  
Name (10.1.50.117:ryan): root  
331 Please specify password  
Password:  
230 Operation successful  
Remote system type is UNIX.  
Using binary mode to transfer files.
```

4. Upload "hello" program to IRU131 from your host PC

```
ftp> put hello  
local: hello remote: hello  
200 Operation successful  
150 Ok to send data  
226 Operation successful  
9669 bytes sent in 0.00 secs (214599.6 kB/s)
```

5. If the operation is successful on the IRU131, you can see 'hello' program on IRU131's */home/root* directory.

```
root@axiomtek:~# ls -l  
-rw-r--r-- 1 root root 9669 Jun 28 08:58 hello
```

6. To change file permission for executable on IRU131.

```
~# chmod a+x hello  
root@axiomtek:~# chmod a+x hello  
root@axiomtek:~# ls -l  
-rwxr-xr-x 1 root root 9669 Jun 28 08:58 hello
```

7. Run the 'hello' program on IRU131.

```
~# ./hello  
root@axiomtek:~# ./hello  
hello world
```

### 2.3.2 Via USB Flash Drive

Another method of putting 'hello' program into IRU131 is via USB flash drive. Please follow the instructions below.

#### IRU131 supports storage format FAT32 /FAT/EXT2/EXT3/EXT4

1. From the host PC, copy 'hello' program to USB flash drive.

2. Attach USB flash drive to IRU131.

3. 

```
~# mkdir /media/sda1
```

```
root@axiomtek:~# mkdir /media/sda1
root@axiomtek:~#
```

4. 

```
~# mount /dev/sda1 /media/sda1
```

```
root@axiomtek:~# mount /dev/sda1 /media/sda1/
root@axiomtek:~# ls /media/sda1/
hello
root@axiomtek:~#
```

5. 

```
~# cp /media/sda1/hello /home/root
```

```
root@axiomtek:~# cp /media/sda1/hello /home/root/
root@axiomtek:~# ls
hello
root@axiomtek:~#
```

6. 

```
~# chmod +x hello
```

```
root@axiomtek:~# ls -l
-rw-r--r-- 1 root root 9669 Sep 16 18:40 hello
root@axiomtek:~# chmod a+x hello
root@axiomtek:~# ls -l
-rwxr-xr-x 1 root root 9669 Sep 16 18:40 hello
root@axiomtek:~#
```

7. 

```
~# ./hello
```

```
root@axiomtek:~# ./hello
hello world
root@axiomtek:~#
```

### 2.3.3 Via TFTP

Originally the Host Development System Installation already has TFTP server installed. You can put the ‘hello’ program into IRU131 via TFTP. Please follow the instructions below.

1. Refer to section 5.1.1 step 4. Install and configure TFTP server for install and setup your TFTP:

2. To copy “hello” program to “tftpboot” folder in host PC  
~\$ cp hello /tftpboot

```
louis@ubuntu:~/project/example$ ls
hello  hello.c
louis@ubuntu:~/project/example$ cp hello /tftpboot/
louis@ubuntu:~/project/example$ ls /tftpboot/
hello
louis@ubuntu:~/project/example$
```

3. To enter the following command on IRU131  
~# tftp -g -r hello 192.168.0.3 (tftp server IP depend on host PC’s IP)

```
root@axiomtek:~# tftp -g -r hello 192.168.0.3
root@axiomtek:~# ls
hello
root@axiomtek:~#
```

4. To enter the following command on IRU131  
~# chmod a+x hello

```
root@axiomtek:~# ls -l
-rw-r--r-- 1 root      root          9669 Sep 16 18:40 hello
root@axiomtek:~# chmod a+x hello
root@axiomtek:~# ls -l
-rwxr-xr-x 1 root      root          9669 Sep 16 18:40 hello
root@axiomtek:~#
```

5. Run the ‘hello’ program on IRU131.  
~# ./hello

```
root@axiomtek:~# ./hello
hello world
root@axiomtek:~#
```

## 2.4 How to Recovery System

In this section, we provide 2 methods showing how to recovery IRU131 system to default.

### 2.4.1 Via run\_rescue System Script (under Linux System)

A recovery script in /etc folder on IRU131 Embedded Linux system. If you want to recovery your system to factory default settings, follow the instructions below.

1. Run the run\_rescue shell script

```
~# /etc/run_rescue
root@axiomtek:~# /etc/run_rescue
Push RESCUE Script to u-boot
Reboot system to RESCUE/UPDATE system

Broadcast message from root@axiomtek (ttymxc0) (Tue Sep 16 20:01:32 2014):
The system is going down for reboot NOW!
INIT: Switching to runlevel: 6
INIT: Sending processes the TERM signal
logout
```

2. When the system reboots, it automatically switches to the rescue mode under u-boot, and starts recovery procedure. During this procedure, four custom LEDs will blink like a marquee.
3. After recovery procedure is completed, the system reboots again automatically, and the system status LED turns from the blinking mode to the always on mode.

### 2.4.2 Via rescue.scr Script (under u-boot)

Refer to section 5.2.2 for detailed information.

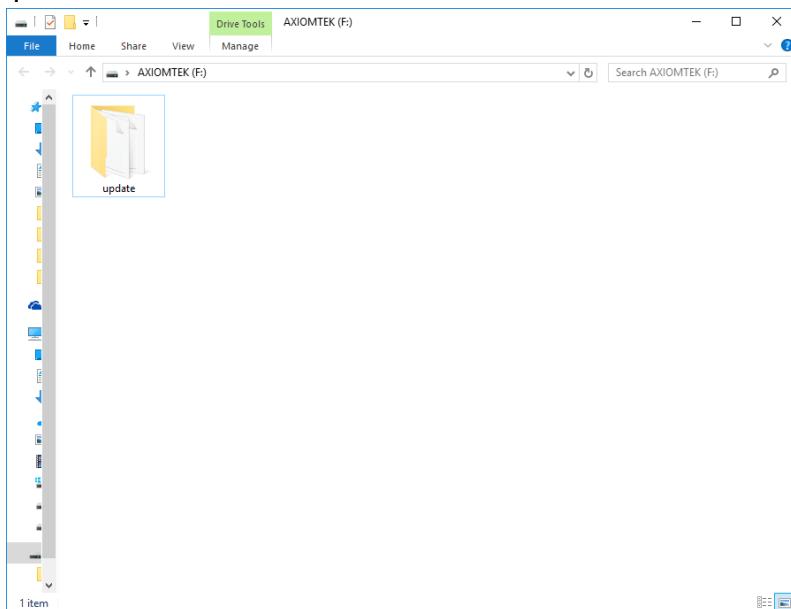

## 2.5 How to Update System

This section shows how to update the IRU131 using the recommended method below

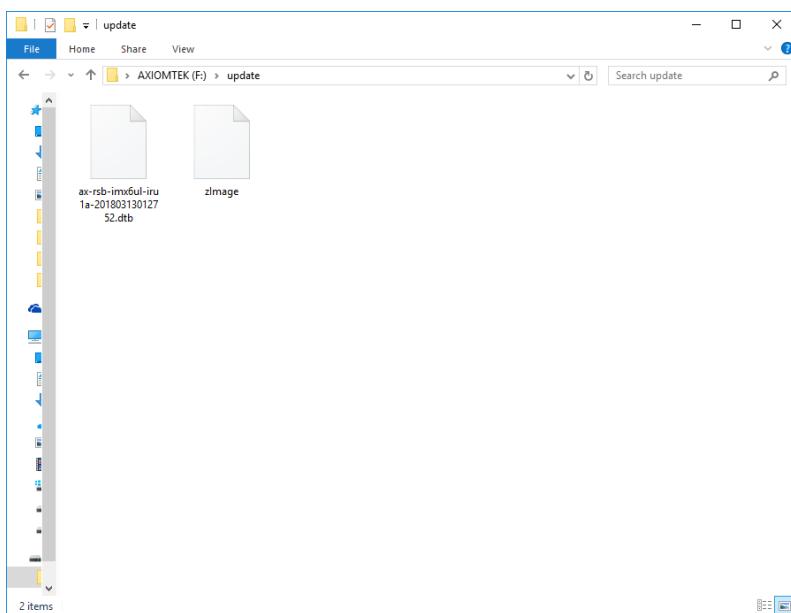

### 2.5.1 Via USB Flash Drive

You can use a USB flash drive of DOS FAT32、EXT2、EXT3 or EXT4 formats, but an update folder must be stored on the first partition

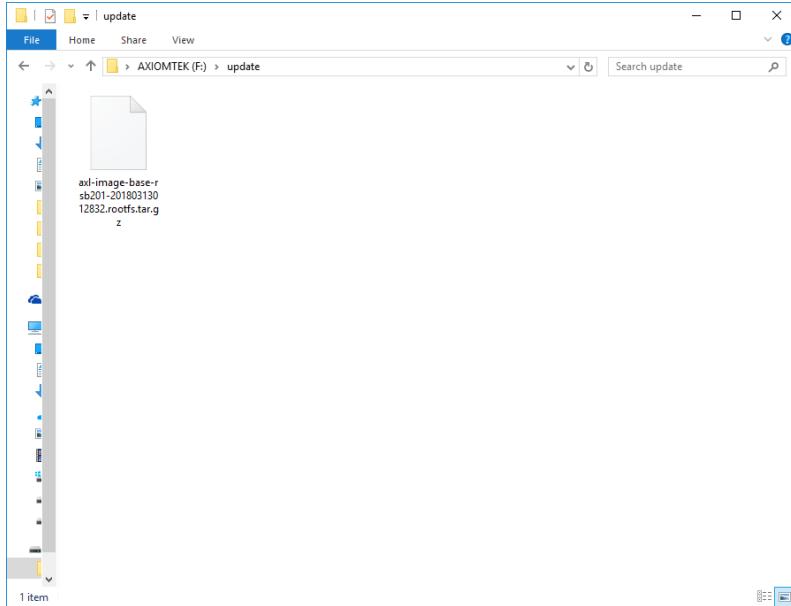

1. From the PC, copy files to USB flash drive.
2. Create a folder name “update”

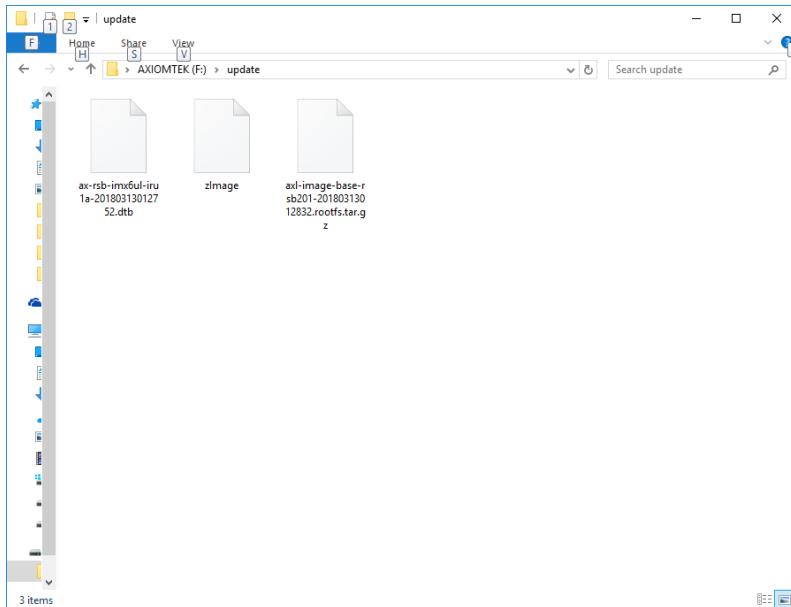

3. If you only want to update the kernel without altering the root filesystem, simply rename the new kernel file to ‘zImage’ and the dtb file to ‘ax-rsb-imx6ul-iru1a.dtbo’ and then put the files in the update folder.

4. If you only want to update root filesystem without altering the kernel, simply put 'axl-\* .rootfs.tar.gz' in the update folder.

5. If you want to update both the kernel and root filesystem, put the three files in the update folder.

6. Attach USB flash drive to IRU131.

7. Run the run\_rescue shell script.

```
~# /etc/run_rescue
```

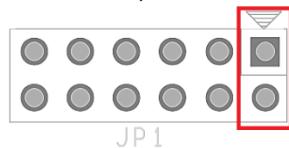

```
sd 0:0:0:0: [sda] Assuming drive cache: write through
sda: sda1
sd 0:0:0:0: [sda] No Caching mode page found
sd 0:0:0:0: [sda] Assuming drive cache: write through
sd 0:0:0:0: [sda] Attached SCSI removable disk
Freeing unused kernel memory: 368K (8088d000 - 808e9000)
INIT: version 2.88 booting
Starting udev
udevd[159]: starting version 182
EXT4-fs (mmcblk1p3): re-mounted. Opts: data=ordered
bootlogd: cannot allocate pseudo tty: No such file or directory
random: dd urandom read with 91 bits of entropy available
random: nonblocking pool is initialized
INIT: Entering runlevel: 5
Starting syslogd/klogd: done
FAT-fs (sda1): Volume was not properly unmounted. Some data may be corrupt. Please
===== Starting Update Kernel Procedure =====
===== Starting Update RootFilesystem Procedure =====
EXT4-fs (mmcblk1p2): mounted filesystem with ordered data mode. Opts: (null)
EXT4-fs (mmcblk1p2): mounted filesystem with ordered data mode. Opts: (null)
Copy Other tools.....
Extracting /media/sda1/update/tools/IFB122-progs-004.tgz
===== Finished =====
After 3 seconds will reboot system...
```

8. During this update procedure, four custom LEDs will blink like marquee. Until procedure finish, the system will reboot again automatically, and system status LED from blinking to always on.

## 2.6 How to use MFG tool to download image

We show you how to use MFG tool to download image to the IRU131 system.

- Before using the MFG tool, you have to change the IRU131 JP1 boot mode (default emmc boot) to OTG serial downloader mode

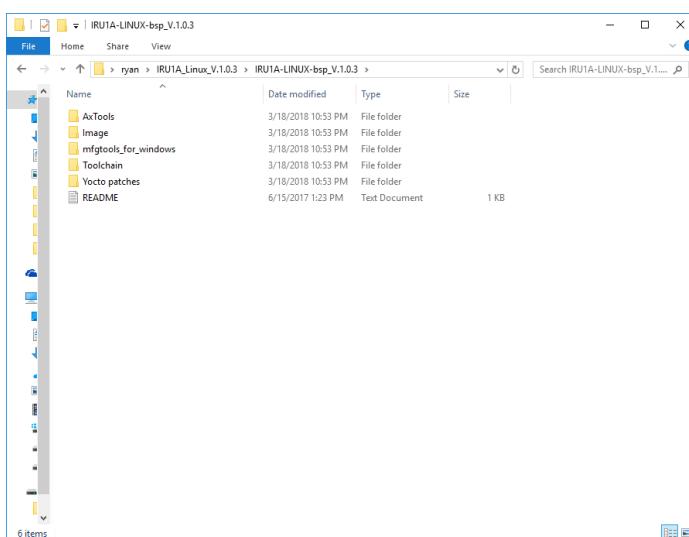

Please change JP3 to OTG Client mode as below .

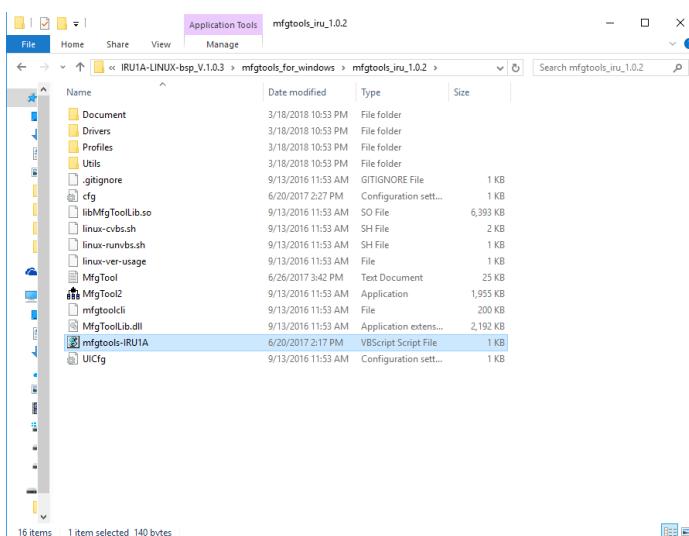

After setting jumper, please connect the IRU131 to PC via USB cable.

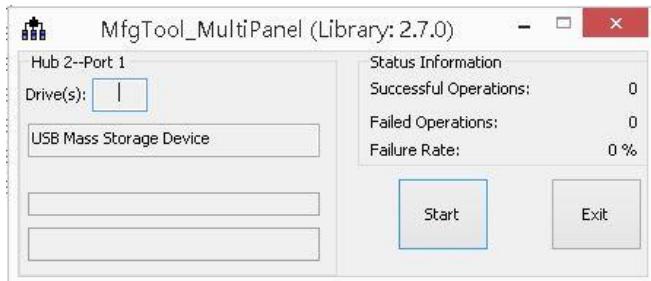

- Extract Axiomtek's Yocto BSP and you will see mfgtools\_iru\_x.x.x in the mfgtools\_for\_windows directory

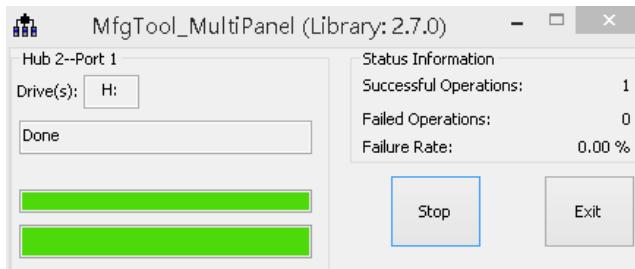

- Enter mfgtools\_for\_windows/mfgtools\_iru\_x.x.x directory

4. After double clicking mfgtools-IRU1A.vbs, click “Start” to start burning

5. After burning has completed, the status will change to “Done” as below.

6. If your burning is successful, please set your jumper JP1 and JP3 to default setting.  
 7. For detailed information about MFG tool, please refer to “Manufacturing Tool V2 Quick Start Guide.docx” in the “Document\V2” directory.

## 2.7 How to install Axiomtek-provided additional packages

This section shows how to install Axiomtek-provided additional packages, such as dotnet core, Node-red, Node.js and OpenJDK. An installed script is stored in the /opt folder on the IRU152 Embedded Linux system. If you want to install these packages, please check your network and follow the instructions below.

### 2.7.1 Install .NET Core package

1. Run the setup\_dotnet\_core shell script.

```
~# /opt/setup_dotnet_core install
```

```
root@rsb201:~/ # /opt/setup_dotnet_core install
##axmsg: install.
##axmsg: Download dotnet-sdk-2.1.400.
Connecting to download.microsoft.com (104.124.16.61:443)
dotnet-sdk-2.1.400-1 45% |*****| 35818k 0:00:19 ETA
```

2. If installation is successful, you need to reboot system. Please press ‘y’ to reboot.

```
root@rsb201:~/ # /opt/setup_dotnet_core install
##axmsg: install.
##axmsg: Download dotnet-sdk-2.1.400.
Connecting to download.microsoft.com (104.124.16.61:443)
dotnet-sdk-2.1.400-1 100% |*****| 78781k 0:00:00 ETA
axmsg: Download dotnet-sdk-2.1.400 success.
##axmsg: Create dotnet-sdk_env file.
##axmsg: Add /opt/dotnet/dotnet_env.sh to /etc/profile.
##axmsg: install dotnet-sdk-2.1.400.
##axmsg: install dotnet-sdk-2.1.400 finish.
##axmsg: Please reboot!!! to apply dotnet-sdk-2.1.400 environment variables.
##axmsg: reboot Now??? (y/n):y
```

3. Check dotnet version.

```
~# dotnet --version
```

```
root@rsb201:~# dotnet --version
2.1.400
```

4. If you want to uninstall, just follow the instructions below and reboot.

```
~# /opt/setup_dotnet_core uninstall
```

```
root@rsb201:~# /opt/setup_dotnet_core uninstall
###axmsg: uninstall dotnet-sdk-2.1.400.
###axmsg: uninstall dotnet-sdk-2.1.400 finish.
###axmsg: Please reboot!!! to apply dotnet-sdk-2.1.400 environment variables.
###axmsg: reboot Now??? (y/n):y
```

## 2.7.2 Install OpenJDK package

1. Run the setup\_dotnet\_core shell script.

```
~# /opt/setup_openjdk install
```

```
rsb201 login: root
root@rsb201:~# /opt/setup_openjdk install
###axmsg: install.
###axmsg: Download Open-JDK-1.8.0_162.
Connecting to cdn_azul_com (54.230.147.95:80)
ezdk-1.8.0_162-8.27. 19% |*****| 26021k 0:02:09 ETA
```

2. If installation is successful, you need to reboot system. Please press 'y' to reboot.

```
root@rsb201:~# /opt/setup_openjdk install
###axmsg: install.
###axmsg: Download Open-JDK-1.8.0_162.
Connecting to cdn_azul_com (54.230.147.95:80)
ezdk-1.8.0_162-8.27. 100% |*****| 131M 0:00:00 ETA
###axmsg: Download Open-JDK-1.8.0_162 success.
###axmsg: Create setting open-jdk_env file.
###axmsg: Add /usr/lib/jvm/openjdk_env.sh to /etc/profile.
###axmsg: install Open-JDK-1.8.0_162.
###axmsg: install Open-JDK-1.8.0_162 finish.
###axmsg: Please reboot!!! to apply Open-JDK-1.8.0_162 environment variables.
###axmsg: reboot Now??? (y/n):y
```

3. Check OpenJDK version.

```
~# java -version
```

```
root@rsb201:~# java -version
openjdk version "1.8.0_162"
OpenJDK Runtime Environment (Zulu Embedded 8.27.0.91-linux-aarch32hf) (build 1.8.0_162-b91)
OpenJDK Client VM (Zulu Embedded 8.27.0.91-linux-aarch32hf) (build 25.162-b91, mixed mode, Evaluation)
```

4. If you want to uninstall, just follow the instructions below and reboot.

```
~# /opt/setup_openjdk uninstall
```

```
root@rsb201:~# /opt/setup_openjdk uninstall
###axmsg: uninstall Open-JDK-1.8.0_162.
###axmsg: uninstall Open-JDK-1.8.0_162 finish.
###axmsg: Please reboot!!! to apply Open-JDK-1.8.0_162 environment variables.
###axmsg: reboot Now??? (y/n):y
```

**This page is intentionally left blank.**

# Chapter 3

## The Embedded Linux

### 3.1 Embedded Linux Image Managing

#### 3.1.1 System Version

This section describes how to determine system version information including kernel and root filesystem version on IRU131.

Check kernel version with the following command:

```
~# uname -r
```

```
root@axiomtek:~# uname -r  
3.14.52-RSB20X-001  
root@axiomtek:~#
```

Check root filesystem with the login screen:

```
Poky (Yocto Project Reference Distro) 1.8.1 axiomtek /dev/ttymxc0  
axiomtek login: [REDACTED]
```

#### 3.1.2 System Time

System time is the time value loaded from RTC each time the system boots up. Read system time with the following command on IRU131:

```
~# date  
root@axiomtek:~# date  
Wed Jun 28 09:28:10 UTC 2017
```

#### 3.1.3 Internal RTC Time

The internal RTC time is read from i.MX processor internal RTC. Note that this time value is not saved, when system power is removed.

Read internal RTC time with the following command on IRU131:

```
~# hwclock -r --rtc=/dev/rtc1  
root@axiomtek:~# hwclock -r --rtc=/dev/rtc1  
Thu Jan  1 03:04:20 1970  0.000000 seconds
```

### 3.1.4 External RTC Time

The external RTC time is read from RS5C372 external RTC. When system power is removed, this time value is kept as RS5C372 is powered by battery.

Read external RTC time with the following command:

```
~# hwclock -r
```

```
root@axiomtek:~# hwclock -r  
Wed Jun 28 09:29:27 2017 0.000000 seconds
```

### 3.1.5 Watchdog timer

Function: wdt\_driver\_test.out

Description: When <sleep> parameters is more than <timeout> parameters, watchdog timer will be trigger

**Note:** The IRU131 has been enabled for default settings, and the default parameters are **10 5 0**

Commands example: ~# wdt 10 5 0 &

```
root@axiomtek:~# wdt  
Usage: wdt_driver_test <timeout> <sleep> <test>  
      timeout: value in seconds to cause wdt timeout/reset  
      sleep: value in seconds to service the wdt  
      test: 0 - Service wdt with ioctl(), 1 - with write()
```

### 3.1.6 Adjusting System Time

1. Manually set up the system time.

Format: YYYYMMDDHHmm.SS

```
~# date -s date 201509161714.05
```

```
root@axiomtek:~# date -s 201706291200.05  
Thu Jun 29 12:00:05 UTC 2017
```

2. Write sync time to internal RTC

```
~# hwclock -w --rtc=/dev/rtc1
```

```
root@axiomtek:~# hwclock -w --rtc=/dev/rtc1  
root@axiomtek:~# hwclock -r --rtc=/dev/rtc1  
Thu Jun 29 12:01:01 2017 0.000000 seconds
```

3. Write sync time to external RTC

```
~# hwclock -w
```

```
root@axiomtek:~# hwclock -w  
root@axiomtek:~# hwclock -r  
Thu Jun 29 12:02:05 2017 0.000000 seconds
```

## 3.2 Networking

### 3.2.1 FTP – File Transfer Protocol

FTP is a standard network protocol used to transfer files from one host to another host over TCP-based network.

The IRU131 comes with a built-in FTP server. Section 2.1 shows the steps to put ‘hello’ program in the IRU131 via FTP.

### 3.2.2 TFTP – Trivial File Transfer Protocol

TFTP is a lightweight protocol of transfer files between a TFTP server and TFTP client over Ethernet. To support TFTP, this embedded Linux image has built-in TFTP client, so does its accompanying bootloader U-boot.

In Chapter 5, there are descriptions of TFTP server installation and kernel boot up process via TFTP. Section 2.3.3 shows you how to transfer file between server and client.

### 3.2.3 NFS – Network File System

NFS enables you to export a directory on an NFS server and mount that directory on remote client machine as if it were a local file system. Using NFS on target machine, we can have access to a huge number of files, libraries, and utilities during development and debugging, as well as booting up kernel.

This embedded Linux kernel is compiled with support for NFS, including server-side, client-side functionality and ‘Root file system on NFS’.

### 3.2.4 How to use 3G or 4G module (Optional)

#### 1. 3G / 4G module connection to the Internet with PPP

This section describes how to use 3G or 4G module to connect to the Internet with PPP

**1.1 If you are using a Quectel UC20 3G module, follow the instructions below.**

Please execute script for internet connection.

```
~# /etc/ppp/ppp-quectel-on  
root@axiomtek:~# /etc/ppp/ppp-quectel-on
```

When you execute script, you may find the information as below.

```
PPP generic driver version 2.4.2
pppd options in effect:
dump          # (from command line)
noauth        # (from /etc/ppp/peers/quectel)
user CARD      # (from /etc/ppp/peers/quectel)
password ?????? # (from /etc/ppp/peers/quectel)
/dev/ttyUSB3    # (from /etc/ppp/peers/quectel)
115200        # (from /etc/ppp/peers/quectel)
lock          # (from /etc/ppp/peers/quectel)
connect /usr/sbin/chat -s -v -f /etc/ppp/quectel-chat-connect      # (from)
disconnect /usr/sbin/chat -s -v -f /etc/ppp/quectel-chat-disconnect
crtscs        # (from /etc/ppp/peers/quectel)
modem         # (from /etc/ppp/peers/quectel)
hide-password  # (from /etc/ppp/peers/quectel)
ipcp-accept-local # (from /etc/ppp/peers/quectel)
ipcp-accept-remote # (from /etc/ppp/peers/quectel)
noipdefault    # (from /etc/ppp/peers/quectel)
defaultroute   # (from /etc/ppp/peers/quectel)
usepeerdns    # (from /etc/ppp/peers/quectel)
nobsdcomp     # (from /etc/ppp/peers/quectel)
root@axiomtek:~#
```

You can execute command ,**ifconfig** to examine PPP0 connection.

```
~# ifconfig
root@axiomtek:~# ifconfig
```

PPP0 will be shown after successful connection.

```
ppp0      Link encap:Point-to-Point Protocol
          inet addr:10.116.2.38 P-t-P:10.64.64.64 Mask:255.255.255.255
                  UP POINTOPOINT RUNNING NOARP MULTICAST MTU:1500 Metric:1
                  RX packets:6 errors:0 dropped:0 overruns:0 frame:0
                  TX packets:5 errors:0 dropped:0 overruns:0 carrier:0
                  collisions:0 txqueuelen:3
                  RX bytes:65 (65.0 B) TX bytes:86 (86.0 B)

root@axiomtek:~#
```

## 1.2 If you are using a Sierra MC7304 4G module, follow the instructions below.

Please execute script for internet connection.

```
~# /etc/ppp/ppp-sierra-on
root@axiomtek:~# /etc/ppp/ppp-sierra-on
```

When you execute script, you may find the information as below.

```
PPP generic driver version 2.4.2
pppd options in effect:
dump          # (from command line)
noauth        # (from /etc/ppp/peers/sierra)
user CARD      # (from /etc/ppp/peers/sierra)
password ?????? # (from /etc/ppp/peers/sierra)
/dev/ttyUSB2    # (from /etc/ppp/peers/sierra)
115200        # (from /etc/ppp/peers/sierra)
lock          # (from /etc/ppp/peers/sierra)
connect /usr/sbin/chat -s -v -f /etc/ppp/sierra-chat-connect      # (from)
disconnect /usr/sbin/chat -s -v -f /etc/ppp/sierra-chat-disconnect
crtscs        # (from /etc/ppp/peers/sierra)
modem         # (from /etc/ppp/peers/sierra)
hide-password  # (from /etc/ppp/peers/sierra)
ipcp-accept-local # (from /etc/ppp/peers/sierra)
ipcp-accept-remote # (from /etc/ppp/peers/sierra)
noipdefault    # (from /etc/ppp/peers/sierra)
defaultroute   # (from /etc/ppp/peers/sierra)
usepeerdns    # (from /etc/ppp/peers/sierra)
nobsdcomp     # (from /etc/ppp/peers/sierra)
root@axiomtek:~#
```

You can execute command ,**ifconfig** to examine PPP0 connection.

```
~# ifconfig  
root@axiomtek:~# ifconfig
```

PPP0 will be shown after successful connection.

```
ppp0      Link encap:Point-to-Point Protocol  
          inet addr:10.33.122.177 P-t-P:10.64.64.64 Mask:255.255.255.255  
          UP POINTOPOINT RUNNING NOARP MULTICAST MTU:1500 Metric:1  
          RX packets:5 errors:0 dropped:0 overruns:0 frame:0  
          TX packets:5 errors:0 dropped:0 overruns:0 carrier:0  
          collisions:0 txqueuelen:3  
          RX bytes:62 (62.0 B) TX bytes:86 (86.0 B)  
  
root@axiomtek:~#
```

## 2 3G / 4G module connection to the Internet with wvdial Tool

### 2.1 If you are using a Quectel UC20 3G module, follow the instructions below.

To create a wvdial config

```
~# vi /etc/wvdial.conf  
root@axiomtek:~# vi /etc/wvdial.conf
```

Please enter your information as below.

```
[Dialer Defaults]  
Modem = /dev/ttyUSB3  
Baud = 115200  
Init 3 =AT+CGDCONT=1,"IP","INTERNET"  
Phone = *99#  
Password = any  
Username = any  
Dial Command = ATD  
Modem Type = Analog Modem  
NEW PPPD = yes
```

Please execute wvdial for internet connection.

```
~# wvdial &  
root@axiomtek:~# wvdial &
```

When you execute wvdial, you may find the information below.

```
[1] 426

root@axiomtek:~#
```

## 2.2 If you are using a Sierra MC7304 4G module, please follow the instructions below.

To create a wvdial config

```
~# vi /etc/wvdial.conf
root@axiomtek:~# vi /etc/wvdial.conf
```

Please enter your information as below.

```
[Dialer Defaults]
Modem = /dev/ttyUSB2
Baud = 115200
Init 3 =AT+CGDCONT=1,"IP","INTERNET"
Phone = *99#
Password = any
Username = any
Dial Command = ATD
Modem Type = Analog Modem
NEW PPPD = yes
```

Please execute wvdial for internet connection.

```
~# wvdial &
```

```
root@axiomtek:~# wvdial &
```

When you execute **wvdial**, you may find the information below.

```
[1] 437
root@axiomtek:~# --> WvDial: Internet dialer version 1.61
--> Cannot get information for serial port.
--> Initializing modem.
--> Sending: ATZ
ATZ
OK
--> Modem initialized.
--> Sending: ATD*99#
--> Waiting for carrier.
ATD*99#
CONNECT 100000000
--> Carrier detected. Waiting for prompt.
--> Don't know what to do! Starting pppd and hoping for the best.
--> Starting pppd at Mon Aug 15 10:51:09 2016
--> Pid of pppd: 441
PPP generic driver version 2.4.2
--> Using interface ppp0
--> local IP address 10.33.122.177
--> remote IP address 10.64.64.64
--> primary DNS address 168.95.1.1
--> secondary DNS address 168.95.192.1

root@axiomtek:~#
```

You can execute command **ifconfig** to examine PPP0 connection

```
~# ifconfig
```

```
root@axiomtek:~# ifconfig
```

PPP0 will be shown after successful connection.

```
ppp0      Link encap:Point-to-Point Protocol
          inet addr:10.33.122.177  P-t-P:10.64.64.64  Mask:255.255.255.255
          UP POINTOPOINT RUNNING NOARP MULTICAST  MTU:1500  Metric:1
          RX packets:5 errors:0 dropped:0 overruns:0 frame:0
          TX packets:5 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:3
          RX bytes:62 (62.0 B)  TX bytes:86 (86.0 B)

root@axiomtek:~#
```

### 3 3G / 4G module connection to the Internet with Ax tool

**3.1 If your 3G/4G module use UC20/MC7304/ LARA-R211/ LARA-R280, you can use ax\_3g4g\_wvdial command.**

```
~# ax_3g4g_wvdial
root@rsb201:~# ax_3g4g_wvdial
###axmsg: create wvdial.conf example tool.
###axmsg: set ublox-LARA-R280 wvdil.conf.
```

According to your 3G/4G module,will create a dependency module's configure

Please execute wvdial for internet connection.

```
~# wvdial &
```

```
root@axiomtek:~# wvdial &
```

When you execute **wvdial**, you may find the information below.

```
root@rsb201:~# wvdial &
[1] 813
root@rsb201:~# --> WvDial: Internet dialer version 1.61
--> Initializing modem.
--> Sending: ATZ

--> pppd: <8T
--> secondary DNS address 172.24.9.22
--> pppd: <8T
```

PPPO will be shown after successful connection

```
ppp0      Link encap:Point-to-Point Protocol
          inet addr:10.203.98.12  P-t-P:10.203.98.12  Mask:255.255.255.255
                      UP POINTOPOINT RUNNING NOARP MULTICAST  MTU:1500  Metric:1
                      RX packets:10 errors:0 dropped:0 overruns:0 frame:0
                      TX packets:9 errors:0 dropped:0 overruns:0 carrier:0
                      collisions:0 txqueuelen:3
                      RX bytes:1091 (1.0 KiB)  TX bytes:386 (386.0 B)
```

### 3.2.5 How to use Wi-Fi module (Optional)

If your Wi-Fi module is WPEQ-160ACN, you can follow the instructions below.

Editor /etc/wpa\_supplicant.conf file

```
~# vi /etc/wpa_supplicant.conf
```

```
root@axiomtek:~# vi /etc/wpa_supplicant.conf
```

Enter your router,s SSID and Password

```
ctrl_interface=/var/run/wpa_supplicant
ctrl_interface_group=0
update_config=1

network={
    ssid="axiomtwek"
    psk="password"
}
```

If the setting is successful, it will automatically connect after reboot.

You can execute command "ifconfig" to check connection.

```
~# ifconfig
```

```
wlan0      Link encap:Ethernet HWaddr B0:1F:81:D0:33:EA  
          inet addr:192.168.0.41 Bcast:192.168.0.255 Mask:255.255.255.0  
          inet6 addr: fe80::b21f:81ff:fed0:33ea/64 Scope:Link  
             UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1  
             RX packets:22 errors:0 dropped:24 overruns:0 frame:0  
             TX packets:26 errors:0 dropped:5 overruns:0 carrier:0  
             collisions:0 txqueuelen:1000  
             RX bytes:5725 (5.5 KiB) TX bytes:5679 (5.5 KiB)  
  
root@rsb101:~#
```

# Chapter 4

## Programming Guide

We release a set of application programming interface (API) functions for users to access/control hardware. With these API functions, users can more easily design their own software. This chapter includes detailed description of each API function and step-by-step code samples showing how it works.

### 4.1 librsb20x API Functions

The IRU131 BSP includes 'librsb10x.so' shared library for users to access I/O and read back system information. This shared library is kept in BSP, you can find it in IRU1A-rsb-lib-x.x.x.tar.gz of AxTools. Extract the compressed file, then besides the shared library you can also see a *demo* folder containing API header file and example programs.

#### Summary table of available API functions

No.	Function	Description
1	Control_WDT	Set WDT funciotn
2	Get_DIP_Switch	Get DIP Switch value
3	Control_USB_PWR_EN	Control USB OTG Power enable
4.	Control_EXP_RST	Control Expansion Board reset
5	Control_WIFI_LINK_LED	Set MINICARD WIFI link led
6	Set_DO0	Set digital output channels 0 state.
7	Set_DO1	Set digital output channels 1 state.
8	Set_DO0_not	Set digital output channels state 0. (reverse)
9	Set_DO1_not	Set digital output channels state 1. (reverse)
10	Get_DI0	Read state on digital input channels 0.
11	Get_DI1	Read state on digital input channels 1.
12	Get_DI0_not	Read state on digital input channels 0.(reverse)
13	Get_DI1_not	Read state on digital input channels 1.(reverse)

#### Com Port SAMPLE CODE:

##### COM receive

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <unistd.h>
#include <errno.h>
#include <termios.h>
#include <fcntl.h>
#include <termios.h>
#include <pthread.h>
#include "serial.h"
```

```
#include <asm-generic/ioctl.h>
#define SET_COM_TYPE 0x542A

## Function: Get\_DIP\_Switch()

<b>Function</b>	<b>int Get_DIP_Switch(int *data);</b>
<b>Description</b>	Read DIP Switch value
<b>Arguments</b>	data: DIP Switch value
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**SAMPLE CODE:**

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <linux/types.h>
#include "librsb20x.h"

int main(int argc, char* argv[]) {
    int xch;
    Get_DIP_Switch(&xch);
    printf("%d\n", xch);
    return 0;
}
```

**Function: Control\_USB\_PWR\_EN()**

<b>Function</b>	<b>int Control_USB_PWR_EN (int data);</b>
<b>Description</b>	Control USB OTG Power
<b>Arguments</b>	data: 0 : Disable 1 : Enable
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**SAMPLE CODE:**

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <linux/types.h>
#include "librsb20x.h"

static void help(void) {
    fprintf(stderr,
            "Usage: command [EN] \n"
            "      EN : 0/1 \n");
    exit(1);
}

int main(int argc, char* argv[])
{
    if( argc !=2 || !(atoi(argv[1])==0 || atoi(argv[1])==1) )
        help();
    int value=atoi(argv[1]);
    Contrl_USB_PWR_EN(value);
    if(value==1)
        printf("Enable USB Power\n");
    else if(value==0)
        printf("Disable USB Power\n");
    return 0;
}
```

**Function: Control\_EXP\_RST ()**

<b>Function</b>	<b>int Control_EXP_RST(void)</b>
<b>Description</b>	Set digital output channels to high or low state.
<b>Arguments</b>	none
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**SAMPLE CODE:**

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <linux/types.h>
#include "librsb20x.h"

int main(int argc, char* argv[])
{
    Contrl_EXP_RST();
    return 0;
}
```

**Function: Control\_WIFI\_LINK\_LED ()**

<b>Function</b>	<b>Int Control_WIFI_LINK_LED(int num, int data);</b>
<b>Description</b>	Set Minicard wifi link led
<b>Arguments</b>	Num: 1 : Minicard 1 2 : Minicard 2 data: 0 : Disable 1 : Enable
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**SAMPLE CODE:**

```
#include <errno.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <linux/types.h>
#include "librsb20x.h"

static void help(void) __attribute__ ((noreturn));
static void help(void) {
    fprintf(stderr,
            "Usage: command [NUM] [ENABLE]\n"
            "      NUM   : 1/2 \n"
            "      ENABLE: 0/1 \n");
```

```

        exit(1);
}

int main(int argc, char *argv[])
{
    if(argc !=3 || !(atoi(argv[1])==1 || atoi(argv[1])==2) || !(atoi(argv[2])==0 || atoi(argv[2])==1) )
        help();
    int num      = atoi(argv[1]);
    int enable = atoi(argv[2]);
    printf("Set WIFI_%d ,link led=%d\n", num, enable);
    Contrl_WIFI_LINK_LED(num, enable);
    exit(0);
}

```

**Function: Control\_WDT ()**

<b>Function</b>	<b>int Control_WDT(int timeout,int sleep_t,int test);</b>
<b>Description</b>	Set WDT Function
<b>Arguments</b>	timeout : value in seconds to cause wdt timeout/reset sleep_t : value in seconds to service the wdt test : 0 – service wdt with ioctl(), 1 – with write()
<b>Return</b>	0: No error. 1: Function fails.

**WDT sample code:**

```

#include <stdio.h>
#include <stdlib.h>

int main()
{
    printf("Function Name : Control_WDT(timeout,sleep_time,test)\n");
    printf("timeout: value in seconds to cause wdt timeout/reset \n");
    printf("sleep_time: value in seconds to service the wdt \n");
    printf("test: 0 - Service wdt with ioctl(), 1 - with write()\n");
    printf("\nRun Contrl_WDT(10,5,0)\n");
    Contrl_WDT(10,5,0);
    return 0;
}

```

**Function: Get\_DI0()**

<b>Function</b>	<b>int Get_DI0(int *data);</b>
<b>Description</b>	Read state on digital input channels 0.
<b>Arguments</b>	data: This function will store digital input data in this argument.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Get\_DI1()**

<b>Function</b>	<code>int Get_DI1(int *data);</code>
<b>Description</b>	Read state on digital input channels 1.
<b>Arguments</b>	data: This function will store digital output data in this argument.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Set\_DO0()**

<b>Function</b>	<code>int Set_DO0(int data);</code>
<b>Description</b>	Set digital output channels state 0.
<b>Arguments</b>	data: Data to be written to digital output channels.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Set\_DO1()**

<b>Function</b>	<code>int Set_DO1(int data);</code>
<b>Description</b>	Set digital output channels state 1.
<b>Arguments</b>	data: Data to be written to digital output channels.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Get\_DI0\_not()**

<b>Function</b>	<code>int Get_DI0_not (int *data);</code>
<b>Description</b>	Read state on digital input channels 0. (reverse)
<b>Arguments</b>	data: This function will store digital input data in this argument.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Get\_DI1\_not ()**

<b>Function</b>	<code>int Get_DI1_not (int *data);</code>
<b>Description</b>	Read state on digital input channels 1. (reverse)
<b>Arguments</b>	data: This function will store digital output data in this argument.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Set\_DO0\_not ()**

<b>Function</b>	<code>int Set_DO0_not (int data);</code>
<b>Description</b>	Set digital output channels state. (reverse)
<b>Arguments</b>	data: Data to be written to digital output channels.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**Function: Set\_DO1\_not ()**

<b>Function</b>	<code>int Set_DO1_not (int data);</code>
<b>Description</b>	Set digital output channels state. (reverse)
<b>Arguments</b>	data: Data to be written to digital output channels.
<b>Return</b>	0: No error. 1: Function fails.
<b>Others</b>	None.

**DIO sample code:**

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <linux/types.h>
#include "librsb20x.h"

int main(int argc, char* argv[])
{
    printf("Axiomtek Control IRU131 DIO test\n");

    int ch0,ch1;
    Set_DO0(0);
    Set_DO1(0);

    Set_DO0(1);
    Set_DO1(1);
    printf("\nDO0 Oput = 1\n");
}
```

```
printf("DO1 Oput      = 1\n");
Get_DI0(&ch0);
printf("DI0 Input      = %d\n", ch0);
Get_DI1(&ch1);
printf("DI1 Input      = %d\n", ch1);
sleep(1);

Set_DO0(0);

printf("DI1 Input      = %d\n", ch1);
Get_DI0_not(&ch0);
printf("DI0 Input not = %d\n", ch0);
Get_DI1_not(&ch1);
printf("DI1 Input not = %d\n", ch1);
sleep(1);

return 0;}
```

## 4.2 Compile Demo Program

### 4.2.1 Install IRU131 I/O Library

Before you develop and compile sample program, you should install Yocto toolchain into development PC. To do so, refer to Chapter 5 Board Support Package.

1. Set up the cross-development environment on your host PC.

```
~$ source /opt/poky/1.8.1/environment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
```

```
ryan@Ubuntu:~$ source /opt/poky/1.8.1/environment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
```

2. To compile and build demo program for the IRU131, do the following:

Change to *your project* directory.

```
~$ cd project/IRU1A-Linux_V.1.0.1/IRU1A-LINUX-V.1.0.1/AxTools
```

```
ryan@Ubuntu:~$ cd project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools$ ls
IRU1A-progs-001.tgz  IRU1A-rsb-lib-1.0.1.tar.gz
```

3. Extract driver source to *your project* directory.

```
~$ tar -z xv -f IRU1A-rsb-lib-1.0.x.tar.gz
```

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools$ tar -z xv -f IRU1A-rsb-lib-1.0.1.tar.gz -C .
rsb_lib/demo/usb_pwr_en
rsb_lib/librsb20x.so.1.0.1
rsb_lib/demo/diotool
rsb_lib/demo/com_mode.c
rsb_lib/demo/dipswitch
rsb_lib/demo/com_mode
rsb_lib/demo/Makefile
rsb_lib/demo/com_port_open
rsb_lib/demo/led_wifi_link.c
rsb_lib/demo/diotest.c
rsb_lib/demo/com_port_open.c
rsb_lib/demo/diotool.c
rsb_lib/demo/led_wifi_link
rsb_lib/demo/serial.h
rsb_lib/librsb20x.so.0
rsb_lib/demo/exp_rst
rsb_lib/demo/wdttest.c
rsb_lib/demo/
rsb_lib/demo/exp_rst.c
rsb_lib/librsb20x.h
rsb_lib/demo/diotest
rsb_lib/
rsb_lib/demo/usb_pwr_en.c
rsb_lib/demo/librsb20x.h
rsb_lib/librsb20x.so
rsb_lib/demo/wdttest
rsb_lib/demo/dipswitch.c
```

4. Change to *rsb\_lib/demo* directory.

```
~$ cd ~/project/rsb_lib/demo
```

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools$ cd rsb_lib/demo/
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools/rsb_lib/demo$ ls
```

5. Build the demo program.

```
~$ make
```

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools/rsb_li  
b/demo$ make  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfloat-abi=hard -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o com_mode com_mode.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfloat-abi=hard -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o com_port_open com_port_open.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfloat-abi=hard -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o dipswitch dipswitch.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfloat-abi=hard -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o diotest diotest.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfloat-abi=hard -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o diotool diotool.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o exp_RST exp_RST.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o usb_pwr_en usb_pwr_en.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o wdtttest wdtttest.c -lrsb20x -L../  
arm-poky-linux-gnueabi-gcc -march=armv7-a -mfpu=neon -mtune=co  
rtex-a7 --sysroot=/opt/poky/1.8.1/sysroots/cortexa7hf-vfp-neon-poky-linux-gnueab  
i -o led_wifi_link led_wifi_link.c -lrsb20x -L../
```

6. Then you should have example programs such as open\_comport, diotest, and commode.

```
ryan@Ubuntu:~/project/IRU1A_Linux_V.1.0.1/IRU1A-LINUX-bsp_V.1.0.1/AxTools/rsb_li  
b/demo$ ls  
com_mode      diotest.c    exp_RST      Makefile      wdtttest.c  
com_mode.c    diotool      exp_RST.c    serial.h  
com_port_open diotool.c   led_wifi_link  usb_pwr_en  
com_port_open.c dipswitch   led_wifi_link.c  usb_pwr_en.c  
diotest       dipswitch.c librsb20x.h    wdtttest
```

#### 4.2.2 Run demo program

Refer to section 2.3 for detailed information.

# Chapter 5

## Board Support Package (BSP)

### 5.1 Host Development System Installation

#### 5.1.1 Install Host System

1. Download Ubuntu 14.04 LTS iso image.

2. Install Ubuntu 14.04.

3. Install host packages needed by Yocto development as follows:

```
~$sudo apt-get install wget git-core unzip texinfo libSDL1.2-dev gawk diffstat \
texi2html docbook-utils python-pysqlite2 help2man \
make gcc g++ desktop-file-utils libgl1-mesa-dev \
libglu1-mesa-dev mercurial autoconf \
automake groff curl lzop asciidoc xterm chrpath \
gcc-multilib g++-multilib
```

i.MX layers host packages for a Ubuntu 14.04 host setup only are:

```
~$ sudo apt-get install u-boot-tools
```

4. Install and configure TFTP server:

After tftpd is installed, configure it by editing /etc/xinetd.d/tftp. Change the default export path (it is either /usr/var/tftpboot or /var/lib/tftpboot) to /. Or change the default export path to whatever directory you want to download from. Then reboot the hardware.

To install tftpd / tftp/ xinetd

```
~$ sudo apt-get install tftpd tftp xinetd
```

To create tftp directory

```
~$ sudo mkdir /tftpboot
~$ sudo chmod -R 777 /tftpboot
~$ sudo chown -R nobody /tftpboot
```

To configure tftp sever.

```
~$ sudo vi /etc/xinetd.d/tftp
```

```
service tftp
{
    socket_type      = dgram
    protocol         = udp
    wait             = yes
    user             = root
    server           = /usr/sbin/in.tftpd
    server_args      = -s /tftpboot
    disable          = no
    per_source        = 11
    cps              = 100 2
    flags            = IPv4
}
```

Then restart the TFTP server.

```
~$ sudo /etc/init.d/xinetd restart
```

5. Install and configure NFS server:

```
~$ sudo aptitude -y install nfs-common nfs-kernel-server portmap
```

To configure nfs server, add lines to */etc/exports* as follows:

```
/tools/rootfs *(rw,sync,no_root_squash)
```

```
~$ sudo vi /etc/exports
```

Create a symbolic link to root filesystem which your build.

```
~$ sudo mkdir /tools
```

```
~$ sudo ln -s ~/project/rootfs /tools/rootfs
```

Then restart the NFS server.

```
~$ sudo /etc/init.d/nfs-kernel-server restart
```

### 5.1.2 Install Yocto Development

1. Setting up the repo utility.

Create a bin folder in the home directory.

```
~$ mkdir ~bin (this step may not be needed if the bin folder already exists)
```

```
~$ curl http://commondatastorage.googleapis.com/git-repo-downloads/repo > ~bin/repo
```

```
~$ chmod a+x ~bin/repo
```

```
louis@ubuntu:~$ mkdir ~bin
louis@ubuntu:~$ curl http://commondatastorage.googleapis.com/git-repo-downloads/
repo > ~bin/repo
      % Total    % Received % Xferd  Average Speed   Time     Time     Time  Current
             Dload  Upload Total   Spent    Spent    Left  Speed
100 26223  100 26223    0      0  3345      0  0:00:07  0:00:07 --:--:--  5815
louis@ubuntu:~$ chmod a+x ~bin/repo
```

Add the following line to the .bashrc file to ensure that the ~bin folder is in your PATH variable.

```
~$ export PATH=~/bin:$PATH
```

```
louis@ubuntu:~$ export PATH=~/bin:$PATH
```

2. Setting up the Git environment

```
~$ git config --global user.name "Your Name"
```

```
~$ git config --global user.email "Your Email"
```

```
louis@ubuntu:~$ git config --global user.name "axiomtek"
louis@ubuntu:~$ git config --global user.email "axio@axiomtek.com.tw"
```

3. Download the Freescale's Yocto BSP source

```
~$ mkdir fsl-community-bsp
```

```
~$ cd fsl-community-bsp
```

```
~$ repo init -u git://git.freescale.com/imx/fsl-arm-yocto-bsp.git -b imx-3.14.52-1.1.0_ga
```

```
louis@ubuntu:~$ mkdir project/fsl-community-bsp
louis@ubuntu:~$ cd project/fsl-community-bsp/
louis@ubuntu:~/project/fsl-community-bsp$ repo init -u git://git.freescale.com/i
mx/fsl-arm-yocto-bsp.git -b imx-3.14.52-1.1.0_ga
Get https://gerrit.googlesource.com/git-repo/clone.bundle
Get https://gerrit.googlesource.com/git-repo
```

```
~$ repo sync
louis@ubuntu:~/project/fsl-community-bsp$ repo sync
Fetching project fsl-community-bsp-base

louis@ubuntu:~/project/fsl-community-bsp$
```

#### 4. Extract Axiomtek's Yocto BSP source

```
~$ tar -xvf ..//IRU1A-LINUX-bsp-1.X.X/Yocto\ patches/IRU1A-meta-axiomtek-x.x.x.tar.gz -C sources
```

```
louis@ubuntu:~/project/fsl-community-bsp$ tar -xvf ..//IFB122-LINUX-bsp-1.0.0/Yocto\ patches/meta-axiomtek-2.5.0.tar.gz -C sources
```

Check meta-axiomtek

```
louis@ubuntu:~/project/fsl-community-bsp/sources$ ls
base          meta-browser  meta-fsl-arm-extra  meta-fsl-demos  meta-qt5
meta-axiomtek  meta-fsl-arm  meta-fsl-bsp-release  meta-openembedded  poky
louis@ubuntu:~/project/fsl-community-bsp/sources$
```

#### 5. Update bblayers.conf

```
~$ vi fsl-community-bsp/sources/base/conf/bblayers.conf
And add this line after  ${BSPDIR}/sources/meta-fsl-demos \
```

```
 ${BSPDIR}/sources/meta-axiomtek \
LCONF_VERSION = "6"
BBPATH = "${TOPDIR}"
BSPDIR := "${@os.path.abspath(os.path.dirname(dgetVar('FILE', True)) + '/../..${BSPDIR}'"
BBFILES ?= ""
BBLAYERS = " \
${BSPDIR}/sources/poky/meta \
${BSPDIR}/sources/poky/meta-yocto \
\
${BSPDIR}/sources/meta-openembedded/meta-oe \
${BSPDIR}/sources/meta-openembedded/meta-multimedia \
\
${BSPDIR}/sources/meta-fsl-arm \
${BSPDIR}/sources/meta-fsl-arm-extra \
${BSPDIR}/sources/meta-fsl-demos \
${BSPDIR}/sources/meta-axiomtek \
"
```

6. First build

Choose your board

```
~$ DISTRO=poky MACHINE=rsb201 source fsl-setup-release.sh -b build
Common targets are:
  core-image-minimal
  meta-toolchain
  meta-toolchain-sdk
  adt-installer
  meta-ide-support

Your build environment has been configured with:

  MACHINE=rsb201
  SDKMACHINE=i686
  DISTRO=poky
  EULA=1
  BSPDIR=
  BUILD_DIR=.
louis@ubuntu:~/project/fsl-community-bsp/build$
```

Start to build image

```
~$ bitbake axl-image-base
louis@ubuntu:~/project/fsl-community-bsp/build$ bitbake axl-image-base
Parsing recipes:  7% |###| ETA:  00:02:32
```

7. After build image finish, you can find the file path.

The file path: project/fsl-community-bsp/build/tmp/deploy/images/rsb201

```
ryan@Ubuntu:~/fsl-community-bsp/build/tmp/deploy/images/rsb201$ ls
axl-image-base-rsb201-20170616062346.rootfs.manifest
axl-image-base-rsb201-20170616062346.rootfs.tar.gz
axl-image-base-rsb201.manifest
axl-image-base-rsb201.tar.gz
modules--3.14.52-r0-rsb201-20170616062330.tgz
modules-rsb201.tgz
README_-_DO_NOT_DELETE_FILES_IN_THIS_DIRECTORY.txt
u-boot.imx
u-boot-rsb201.imx
u-boot-sd-2015.04-r0.imx
zImage
zImage--3.14.52-r0-ax-rsb-imx6ul-iru1a-20170616062330.dtb
zImage--3.14.52-r0-rsb201-20170616062330.bin
zImage-ax-rsb-imx6ul-iru1a.dtb
zImage-rsb201.bin
```

### 5.1.3 Build and Install user's Yocto Toolchain

We have provided Yocto Toolchain in IRU131 BSP. However, if you want to build your own toolchain using Yocto development, you can follow the instructions on the host PC:

1. Change to *Yocto development* directory.

```
~$ source setup-environment build
louis@ubuntu:~/project/fsl-community-bsp$ source setup-environment build
Welcome to Freescale Community BSP

The Yocto Project has extensive documentation about OE including a
reference manual which can be found at:
    http://yoctoproject.org/documentation

For more information about OpenEmbedded see their website:
    http://www.openembedded.org/

You can now run 'bitbake <target>'

Common targets are:
    core-image-minimal
    meta-toolchain
    meta-toolchain-sdk
    adt-installer
    meta-ide-support
```

```
~$ bitbake meta-toolchain
louis@ubuntu:~/project/fsl-community-bsp/build$ bitbake meta-toolchain
Parsing recipes:  86% |#####| ETA: 00:00:23
```

2. After these steps to generate the toolchain into the Build Directory, you can find the file path: project/fsl-community-bsp/build/tmp/deploy/sdk

Install the toolchain into your host system /opt directory.

Note: Installing the toolchain requires root authorization

```
~$ bash poky-glibc-x86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
```

```
louis@ubuntu:~/project/fsl-community-bsp/build/tmp/deploy/sdk$ bash poky-glibc-x
86_64-meta-toolchain-cortexa7hf-vfp-neon-toolchain-1.8.1.sh
Enter target directory for SDK (default: /opt/poky/1.8.1):
You are about to install the SDK to "/opt/poky/1.8.1". Proceed[Y/n]?y
[sudo] password for louis:
Extracting SDK...done
Setting it up...done
SDK has been successfully set up and is ready to be used.
louis@ubuntu:~/project/fsl-community-bsp/build/tmp/deploy/sdk$
```

## 5.2 U-Boot for IRU131

### 5.2.1 Booting the System from eMMC (IRU131 default)

```
=> run bootcmd

Hit any key to stop autoboot: 0
=> run bootcmd
switch to partitions #0, OK
mmc1(part 0) is current device
switch to partitions #0, OK
mmc1(part 0) is current device
reading boot.scr
** Unable to read file boot.scr **
reading zImage
5263808 bytes read in 132 ms (38 MiB/s)
Booting from mmc ...
reading ax-rsb-imx6ul-ifb122.dtb
31768 bytes read in 18 ms (1.7 MiB/s)
Kernel image @ 0x80800000 [ 0x000000 - 0x5051c0 ]
## Flattened Device Tree blob at 83000000
    Booting using the fdt blob at 0x83000000
    Using Device Tree in place at 83000000, end 8300ac17

Starting kernel ...

Booting Linux on physical CPU 0x0
Linux version 3.14.52-RSB10X-003 (jrtiger@test-H97M-D3H) (gcc version 4.9.2 (GC6
CPU: ARMv7 Processor [410fc075] revision 5 (ARMv7), cr=10c53c7d
CPU: PIPT / VIPT nonaliasing data cache, VIPT aliasing instruction cache
```

### 5.2.2 Booting the Rescue System from eMMC

If the Embedded Linux system is damaged and unable to boot, you can recovery the Linux system on u-boot through rescue mode.

```
=> setenv script rescue.scr
=> run bootcmd

Hit any key to stop autoboot: 0
=> setenv script rescue.scr
=> run bootcmd
switch to partitions #0, OK
mmc1(part 0) is current device
switch to partitions #0, OK
mmc1(part 0) is current device

Starting kernel ...

Booting Linux on physical CPU 0x0
```

# Appendix

## Frequently Asked Questions

### Q1. When I use toolchain to compile, I can't find " include" file.

A1: Refer to section 2.3 and 2.2.2 Setting up the Cross-Development Environment for detailed information.

For example: \$CC hello.c -o hello

```

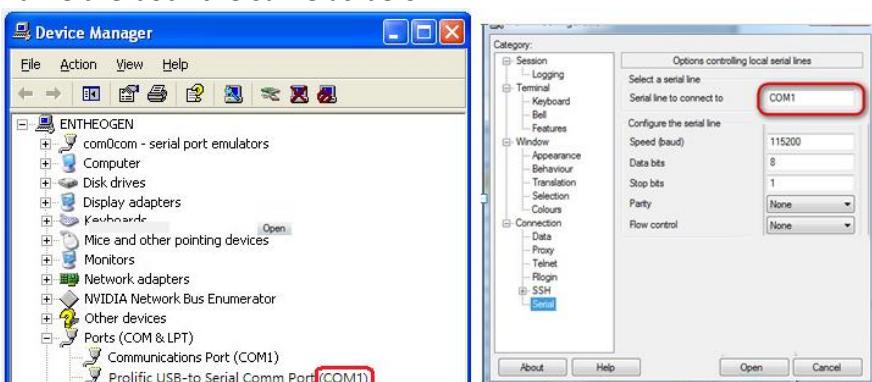

louis@axio-pc:~/work/IFB22/test_program$ ls /opt/fsl-imx-x11/3.14.52-1.1.0
environment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
site-config-cortexa7hf-vfp-neon-poky-linux-gnueabi
sysroots
version-cortexa7hf-vfp-neon-linux-gnueabi
louis@axio-pc:~/work/IFB22/test_program$ source /opt/fsl-imx-x11/3.14.52-1.1.0/e
nvironment-setup-cortexa7hf-vfp-neon-poky-linux-gnueabi
louis@axio-pc:~/work/IFB22/test_program$
louis@axio-pc:~/work/IFB22/test_program$ arm-poky-linux-gnueabi-gcc hello.c -o h
ello
hello.c:1:18: fatal error: stdio.h: No such file or directory
 #include<stdio.h>
 ^
compilation terminated.
louis@axio-pc:~/work/IFB22/test_program$ 
```

### Q2. Why does the screen show nothing as below after I follow the steps described in section 2.1.1 to set up?

A2. Please follow steps as below

1. To check your power.
2. To check serial item "COM port" name and Device Manager "COM port" name are both the same as below.

3. To check if your RS232 port jumper.

**Q3. Why can't transfer the file to FTP、TFTP、NFS after following the instructions, or disconnection.**

A3: Check whether your firewall has been blocked in your host PC or router.
